

## Use case diagram specification

1. **New customer** and **existing account users** are generalizations of **bank account holder**;
2. **New customer** can *sign up* online account;
3. Both **new customer** and **existing account users** can *login in account* by *verifying username and password*;
4. Both **new customer** and **existing account users** can *transfer/deposit/withdraw* money from their bank account;
5. *View account details* is involved in an includes relationship among *money transfer/deposit/withdraw* because all these operations need to check if the account balance is enough or not;
6. *View account balance* is extended from *View account details* because sometimes the bank clerks may just need to know the balance instead of account details;
7. *Verify username and password* is involved in an includes relationship among *account signup, login account and forget password*;
8. Both **Existing account users** and **bank clerks** could use *forget password* to reset their login credentials; But not all the users would need to use this to login; So *forget password* is extended from *login in account*;
